## 1 Introduction

We prove a Pieri formula for motivic Chern classes of Schubert cells in the equivariant K-theory of Grassmannians, which is described in terms of ribbon operators on partitions. Our approach is to convert the Schubert calculus over Grassmannians into the calculation in a certain affine Hecke algebra. As a consequence, we derive a Pieri formula for Segre motivic classes of Schubert cells in Grassmannians. We apply the Pieri formulas to discover a relation between motivic Chern classes and Segre motivic classes, extending a well-known relation between the classes of structure sheaves and ideal sheaves. As another application, we find a symmetric power series representative for the class of the dualizing sheaf of a Schubert variety.

## 2 The Pieri rules

Our result is a Pieri rule for motivic Chern classes, a common generalization of Grothendieck polynomial and Chern–Schwartz–MacPherson classes over Grassmannians.

**Chevalley formula** The Chevalley formula for **motivic Chern classes** is given by adding a ribbon and counting width

$$c_1(\mathcal{V}^\vee) \cdot \text{MC}_y(Y(\lambda)^\circ) = (1+y) \sum_{\mu=\lambda+\square} (-y)^{\text{wd}(\mu/\lambda)-1} \text{MC}_y(Y(\mu)^\circ).$$

Example:

$$\begin{array}{c} \begin{array}{|c|c|c|} \hline & & \\ \hline & & \\ \hline & & \\ \hline \end{array} \mapsto (1+y) \left( \begin{array}{|c|c|c|c|} \hline & & & \\ \hline & & & \\ \hline & & & \\ \hline & & & \\ \hline \end{array} + \begin{array}{|c|c|c|} \hline & & \\ \hline & & \\ \hline & & \\ \hline & & \\ \hline \end{array} - y \begin{array}{|c|c|c|} \hline & & \\ \hline & & \\ \hline & & \\ \hline & & \\ \hline \end{array} + y^2 \begin{array}{|c|c|c|c|} \hline & & & \\ \hline & & & \\ \hline & & & \\ \hline & & & \\ \hline \end{array} \right) \\ + \begin{array}{|c|c|c|} \hline & & \\ \hline & & \\ \hline & & \\ \hline & & \\ \hline \end{array} - y \begin{array}{|c|c|c|c|} \hline & & & \\ \hline & & & \\ \hline & & & \\ \hline & & & \\ \hline \end{array} + y^2 \begin{array}{|c|c|c|c|} \hline & & & \\ \hline & & & \\ \hline & & & \\ \hline & & & \\ \hline \end{array} + \begin{array}{|c|c|c|} \hline & & \\ \hline & & \\ \hline & & \\ \hline & & \\ \hline \end{array} \\ - y \begin{array}{|c|c|c|} \hline & & \\ \hline & & \\ \hline & & \\ \hline & & \\ \hline \end{array} + y^2 \begin{array}{|c|c|c|c|} \hline & & & \\ \hline & & & \\ \hline & & & \\ \hline & & & \\ \hline \end{array} - y^3 \begin{array}{|c|c|c|} \hline & & \\ \hline & & \\ \hline & & \\ \hline & & \\ \hline \end{array} + y^4 \begin{array}{|c|c|c|c|} \hline & & & \\ \hline & & & \\ \hline & & & \\ \hline & & & \\ \hline \end{array} \end{array}$$

**Pieri formula** Let us denote **ribbon Schubert operators**

$$[i] \rightarrow \text{MC}_y(Y(\lambda)^\circ) = (1+y) \sum_{\mu} (-y)^{\text{wd}(\mu/\lambda)-1} \text{MC}_y(Y(\mu)^\circ)$$

where the sum over  $\mu = \lambda +$  a ribbon strip with its tail at the  $i$ -th row. Then our Pieri formula can be stated as follows.

$$c_r(\mathcal{V}^\vee) \cdot \text{MC}_y(Y(\lambda)^\circ) = \sum_{1 \leq i_1 < \dots < i_r \leq k} [i_r] \rightarrow \dots [i_1] \rightarrow \text{MC}_y(Y(\lambda)^\circ).$$

We also proved the equivalence of the following two operators

$$[i] \dots \text{with its tail at the } i\text{-th row} \dots \longleftrightarrow [i] \dots \text{with its head at the } i\text{-th row} \dots$$

Example:

**Affine Hecke Algebra** Our approach is by introducing a version of affine Hecke algebra of three parameters. It turns out that  $p, q, h$  control the following ribbon statistics

$$p : \text{height} - 1, \quad q : \text{width} - 1, \quad h : \text{number of ribbons}.$$

We have the following table

classes	$(p, q, h)$	Pieri rule
$[Y(\lambda)]$	$(0, 0, 1)$	adding boxes $\square$
$[\mathcal{O}_{Y(\lambda)}]$	$(1, 0, 1)$	adding vertical strips $\begin{array}{ c } \hline \\ \hline \end{array}$
$c_{\text{SM}}(Y(\lambda)^\circ)$	$(1, 1, 1)$	adding ribbons $\begin{array}{ c c } \hline & \\ \hline \end{array}$
$\text{MC}_y(Y(\lambda)^\circ)$	$(1, -y, 1+y)$	adding ribbons $\begin{array}{ c c } \hline & \\ \hline \end{array}$ & width

This unifies many results [1–3].

## 3 Applications

**Relations with SMC classes** We proved the Segre motivic class (the opposite dual basis) has the same Pieri rule.

Since they have the same Pieri rule, we arrive a surprising result on their relations

$$\lambda_y(\mathcal{T}_{\text{Gr}(k,n)}^\vee) \cdot (1 - [\mathcal{O}_{Y(\square)}]) \cdot \text{SMC}_y(Y(\lambda)^\circ) = \text{MC}_y(Y(\lambda)^\circ).$$

This generalizes the famous relation between ideal sheaves and structure sheaves  $(1 - [\mathcal{O}_{Y(\square)}]) \cdot [\mathcal{O}_{Y(\lambda)}] = [\mathcal{I}_{\partial Y(\lambda)}]$  by Buch [4].

**Representatives for dualizing sheaves** By [5],

$$\text{MC}_y(Y(\lambda)^\circ) = y^{\dim}[\omega_{Y(\lambda)}] + (\text{lower } y\text{-degree})$$

where  $\omega_{Y(\lambda)}$  is the dualizing sheaf of the Schubert variety. In the Pieri rule of motivic Chern classes, only the horizontal strip  $\square$  contributes the highest  $y$ -degree.

Using this fact and Pieri rule, we proved

$$((1 - G_\square)^n J_\lambda)(x_1, \dots, x_k, 0, \dots) = [\omega_{Y(\lambda)}] \in K(\text{Gr}(k, n))$$

where  $J_\lambda$  be its omega involution of the stable grothendieck polynomial (without sign). By Lam and Pylyavskyy [6],  $J_\lambda$  is given by a sum over weak set-valued tableaux:

$$J_\lambda = \sum_{T \in \text{WSVT}(\lambda)} x^T, \quad \text{e.g.} \quad \begin{array}{|c|c|c|c|} \hline 11 & 334 & 55 & 6 \\ \hline 12 & 4 & & \\ \hline 223 & & & \end{array} \begin{cases} \text{filled by nonempty multi-sets} \\ \text{strictly increasing in row} \\ \text{weakly increasing in column} \end{cases}$$

**Hodge diamond of smooth Plücker surface** Using our Pieri rule, we get a fast algorithm of computing the Hodge diamond of a smooth Plücker surface in Grassmannian. For example

$$Y \subset \text{Gr}(3, 5) \quad \text{Gr}(3, 6) \quad \text{Gr}(3, 7) \quad \text{Gr}(3, 8) \quad \text{Gr}(3, 9) \quad \text{Gr}(3, 10)$$

$$\begin{array}{cccccc} \diamond & \begin{array}{c} 1 \\ 1 \\ 2 \\ 2 \\ 1 \end{array} & \begin{array}{c} 1 \\ 1 \\ 2 \\ 3 \\ 4 \\ 3 \\ 2 \\ 1 \end{array} & \begin{array}{c} 1 \\ 1 \\ 2 \\ 3 \\ 4 \\ 4 \\ 4 \\ 3 \\ 2 \\ 1 \end{array} & \begin{array}{c} 1 \\ 1 \\ 2 \\ 3 \\ 4 \\ 5 \\ 6 \\ 7 \\ 6 \\ 5 \\ 4 \\ 3 \\ 2 \\ 1 \end{array} & \begin{array}{c} 1 \\ 1 \\ 2 \\ 3 \\ 4 \\ 5 \\ 6 \\ 7 \\ 8 \\ 7 \\ 6 \\ 5 \\ 4 \\ 3 \\ 2 \\ 1 \end{array} & \begin{array}{c} 1 \\ 1 \\ 2 \\ 3 \\ 4 \\ 5 \\ 6 \\ 7 \\ 8 \\ 9 \\ 10 \\ 9 \\ 8 \\ 7 \\ 6 \\ 5 \\ 4 \\ 3 \\ 2 \\ 1 \end{array} \end{array}$$
